11.9

(b) 若其開始為靜止,在10s內轉了幾圈?

一  $40 \text{ N} \cdot \text{m}$  的力矩作用於一轉動慣量為  $10 \text{ kg} \cdot \text{m}^2$  的輪上 5 s 之後除去。(a) 輪角加速度為何?

●例題

**解**(a) 依力矩公式:

$$\tau = I\alpha \Rightarrow \alpha = \frac{\tau}{I} = \frac{40}{10} = 4 \text{ rad/s}^2$$

(b) 
$$\sim 5 \text{ Fb} \ (\alpha = 4 \text{ rad/s}^2) : \Delta \theta_1 = \frac{1}{2} \alpha t_1^2 = \frac{1}{2} \times 4 \times 5^2 = 50 \text{ rad}$$
  
$$\omega_1 = \alpha t_1 = 4 \times 5 = 20 \text{ rad/s}$$

5 ~ 10 
$$\Rightarrow$$
 ( $\alpha = 0 \text{ rad/s}^2$ ) :  $\Delta \theta_2 = \omega t_2 = 20 \times 5 = 100 \text{ rad}$   
0 ~ 10  $\Rightarrow$  :  $\Delta \theta = \Delta \theta_1 + \Delta \theta_2 = 50 + 100 = 150 \text{ rad} = 23.9 \text{ rev}$
